**ANALYSIS OF CT ENTEROGRAPHY IN EVALUATION OF  
SMALL BOWEL DISORDERS IN PAKISTAN**<sup>1</sup>Abuzar Ghaffari, <sup>2</sup>Ahmad Raza, <sup>3</sup>Dr Madiha Irshad<sup>1</sup>Rural Health Centre Zafarwal, Narowal, abuzar153@gmail.com<sup>2</sup>Basic Health Unit Pindi Porbian, Zafarwal Narowal, dr\_ahmadraza11@yahoo.com<sup>3</sup>Health republic centre 439J block DHA EME sector Lahore, madihashah0341@gmail.com**Abstract:**

**Introduction:** The small intestine is a difficult part of the gastrointestinal tract (GIT) for clinical diagnostic radiology because of its length and complex loops. **Aims and objectives:** The basic aim of the study is to analyse the CT enterography in evaluation of small bowel disorders in Pakistan. **Material and methods:** This descriptive study was conducted in Mayo Hospital Lahore during April till November 2018. All the patients which were clinically diagnosed to small bowel disorders was included in this study. Those who were suffer from any other type of allergy, pregnancy and acute infection were excluded from this study. The data was collected from 30 patients. All the data were collected with the collaboration of department of surgery. The age range for this study was 20 to 50 years. **Results:** The data was collected from 30 patients. By and large, 19(63.3%) patients were guys, while 11(36.7%) were females. The mean age of the patients was 33.6±19.2 years (go: 24-67 years). Plus, 22(73.3%) patients had dynamic disease with intestinal side effects, including stomach torment, loose bowels and haemafaecia. Notwithstanding, 8(26.6%) haemafaecia patients showed no extra clinical manifestations. The CTE and MRE imaging results showed no huge contrast in determination ( $p>0.05$ ), with a precision of 80% for CTE. **Conclusion:** It is concluded that CTE can be valuable in diagnosing small intestinal diseases. However, both procedures have advantages and disadvantages.

**Key words:** CTE, Small, Bowel, Disorders, Patients.

**INTRODUCTION:**

The small intestine is a difficult part of the gastrointestinal tract (GIT) for clinical diagnostic radiology because of its length and complex loops. New imaging methods for diagnosing small intestine diseases, including registered tomography enterography (CTE) and attractive reverberation enterography (MRE), are getting progressively prevalent. CTE is performed after the intestinal lumen is filled with differentiate operator<sup>1</sup>. Not exclusively can CTE distinguish intestinal pathologies, for example, inside divider thickening, mucosal upgrade, entrail divider stratification, luminal stenosis, and mesenteric vasodilation, yet it additionally has one of a kind points of interest in diagnosing extra-intestinal diseases. MRE includes filling the small intestine with isotonic mannitol<sup>2</sup>. The mesenteric small intestine remains the main gastrointestinal tract portion for which indicative examination isn't chiefly subject to endoscopic review. Since radiologists accept essential accountability in the analytic assessment of the small inside, it is basic that methods prepared to do precisely showing small entrail morphology are fittingly applied<sup>3</sup>. Jacob Gersham Cohem presented blend of air and basic water suspension of barium sulfate through duodenal cylinder to create twofold difference impact that was named enteroclysis barium complexity ponders and enteroclysis, specifically, were the backbone of small gut imaging before<sup>4</sup>.

MR and CT methods improved for small entrail imaging are assuming an expanding job in the assessment of small inside clutters. A few studies have demonstrated the benefits of these procedures over customary barium fluoroscopic assessments because of upgrades in spatial and fleeting goals joined with improved inside distending specialists<sup>5</sup>. The inclination of MR versus CT has been geological and dependent on mastery and open strategy. With the expanding consciousness of radiation introduction, there has been an increasingly global enthusiasm for actualizing systems that either decrease or dispose of radiation presentation<sup>6</sup>.

This is particularly significant in patients with ceaseless diseases, for example, incendiary entrail disease who may require numerous examinations over a lifetime or in thinks about that require consecutive imaging time focuses, for example, in evaluation of gastrointestinal motility<sup>7</sup>. X-ray has numerous properties that make it appropriate to imaging of the small entrail: the absence of ionizing radiation, the improved tissue differentiate that can be gotten by utilizing an assortment of heartbeat successions, and the capacity to perform continuous useful imaging. Also, MR modalities permit

perception of the whole inside, without covering gut circles, just as the discovery of both intra-and extraluminal variations from the norm<sup>8</sup>.

**Aims and objectives**

The basic aim of the study is:

- To analyse the CT enterography in evaluation of small bowel disorders in Pakistan.

**MATERIAL AND METHODS:**

This descriptive study was conducted in Mayo Hospital Lahore during April till November 2018. All the patients which were clinically diagnosed to small bowel disorders was included in this study. Those who were suffer from any other type of allergy, pregnancy and acute infection were excluded from this study. The data was collected from 30 patients. All the data were collected with the collaboration of department of surgery. The age range for this study was 20 to 50 years.

**Data collection**

Bowel preparation was finished utilizing low residue diet, plentiful liquids, laxative on the day preceding the assessment and nothing by mouth upon the arrival of the assessment. Isoosmotic mannitol at room temperature was utilized as impartial enteral complexity specialist. 20% of 450ml mannitol weakened with enough plain water to make 1500ml. Patient was approached to drink arrangement each 5minutes to convey persistent oral implantation over a time of 50minutes. An antispasmodic specialist (Inj. buscopan 20mg IV) was given intravenously before CT securing. From there on, persistent was taken up for CT checking. 100-120ml of non-ionic iodinated differentiate media was injected intravenously through a 20-check cannula at a pace of 4.5ml/sec.

**Statistical analysis**

Standardized statistical methods were used for the final analysis. The sensitivity, specificity, accuracy, positive and negative predictive value of CT enterography were calculated.

**RESULTS:**

The data was collected from 30 patients. By and large, 19(63.3%) patients were guys, while 11(36.7%) were females. The mean age of the patients was 33.6±19.2 years (go: 24-67 years). Plus, 22(73.3%) patients had dynamic disease with intestinal side effects, including stomach torment, loose bowels and haemafaecia. Notwithstanding, 8(26.6%) haemafaecia patients showed no extra clinical manifestations. The CTE and MRE imaging results showed no huge contrast in determination ( $p>0.05$ ), with a precision of 80% for CTE.

Further, 11(36.6%) cases were determined to have small bowel tumor sores by CTE, with a steady, exact analysis. Utilizing CTE, the tumors were recognized by rich blood supply and some intestinal obstacle. Eight instances of the essential tumors were situated in the extra-intestine, and there were

calcification spots in the tumors. In three cases, tumors demonstrated fundamentally augmented encouraging corridors and depleting veins, and there was noteworthy intestinal deterrent.

**Figure 01:** Image of disorder indicated by CTE. A: CTE image at transverse position. B: CTE image at coronal position. C: CTE image at sagittal position. D: Intestinal tract above the obstruction point.

**Figure 02:** CTE image at different position indicated malformations.

### DISCUSSION:

Tumours of the small bowel are rare, accounting for about 3%-6% of all gastrointestinal neoplasm. The clinical side effects are frequently vague, and consequences of routine analytic tests are uncertain. Generally, small-bowel follow through with enteroclysis has been utilized for imaging patients suspected of having smallbowel tumors<sup>7</sup>. In an investigation, 14 patients were suspected of having low-grade will bowel deterrent. CT enterography had the option to show the site, level, and reason for the obstacle in every one of the patients with an affectability and explicitness of 100%. CT plainly delineates pathologic procedures including the bowel divider as well as the mesentery, mesenteric vessels, and peritoneal hole. ID of enlarged proximal bowel and crumbled distal bowel was demonstrative for bowel hindrance<sup>8</sup>.

In an examination by Zhang LH *et al*, CT-E has been accounted for to have more prominent affectability (89%) and particularity (100%) than traditional CT (half and 94%, separately) in patients suspected of having an incomplete small bowel obstruction.<sup>17</sup> The general affectability, explicitness, positive prescient worth, negative prescient worth and exactness were 95.83%, 100%, 100%, 85.71% and 96.66% individually<sup>9</sup>. This contrasts well and writing. 18 The job of CT enterography keeps on developing inside the milieu of customary assessments and contending systems<sup>10-11</sup>. CT enterography has begun to supplant the small bowel follow-through assessment and routine CT at the foundation in the investigation of a range of small bowel issue on account of its predominant presentation. Moreover, as a result of the great fairness and high affectability of CT enterography and clinician's inclination for this assessment, creator anticipate it turning into the methodology of decision in patients with an assumed analysis of small bowel issue<sup>12</sup>.

### CONCLUSION:

It is concluded that CTE can be valuable in diagnosing small intestinal diseases. However, both procedures have advantages and disadvantages. Evolving CTE technology is likely to play increasingly important roles in diagnosing small bowel disease. The accuracy of diagnosis will be improved when the results of both techniques can be compared. A larger trial is under way to confirm the findings of this study, which was limited by a small sample size.
